

Clonic

Chloramphenicol Eye Drops BP

Composition:

Chloramphenicol BP	0.5% w/v
Phenylmercuric Nitrate BP	0.001% w/v
(As preservative)	
Sterile Isotonic Base	q.s.

Indication:

1. Anterior segment of the eye, infectious conjunctival conditions, and corneal ulcers.
2. Preparation for ocular surgery and post-operative use.

Mechanism of Action:

Chloramphenicol is a bacteriostatic agent that inhibits protein synthesis. It prevents protein chain elongation by inhibiting the peptidyl transferase activity of the bacterial ribosome.

Dosage:

Instill 1–2 drops every 3 hours (or more frequently) during the first 48 hours, followed by less frequent intervals.

Side Effects:

Hypersensitivity reactions.

Notes and Precautions:

Avoid use in newborns or patients with a history of bone marrow insufficiency.

For external use only.

Manufactured in India:
